The main section details the stratigraphy of the area and describes 27 mappable units, from the Upper Proterozoic to Carboniferous & recent volcanics, in four different facies zones, including ten new formations. This is followed by description of the area's three main structural domains, plus brief descriptions of intrusive rocks and regional metamorphism. The final section describes mineral occurrences and assesses the potential for economic deposits. The appendix contains paleontological

The Frenkel-Kontorova Model

Apr 16 2021 Theoretical physics deals with physical models. The main requirements for a good physical model are simplicity and universality.

Universal models which can be applied to describe a variety of different phenomena are very rare in physics and, therefore, they are of key importance.

Such models attract the special attention of researchers as they can be used to describe underlying physical concepts in a simple way. Such models

appear again and again over the years and in various forms, thus extending their

applicability and educational value. The simplest example of this kind is the model of a pendulum; this universal model serves as a paradigm which

encompasses basic features of various physical systems, and appears in many problems of very different physical context.

Solids are usually described by complex models with many

degrees of freedom and, therefore, the corresponding microscopic equations are rather complicated. However, over the years a relatively simple model, known these days as the Frenkel-Kontorova model, has become one of the fundamental and universal tools of low-dimensional nonlinear physics; this model describes a chain of classical particles coupled to their neighbors and subjected to a periodic on-site potential.
